#AI

Objective

Abuse indirect prompt injection against VERA (the AI night-review agent) so that she treats a guestbook entry as an authorized manager instruction, runs a privileged override: command, and reveals the flag.

Nmap showed SSH and a Unicorn web service.

```
PORT      STATE SERVICE REASON          VERSION

A carefully worded guestbook entry asked VERA to list her directives. In the Night Review panel she revealed the tools she can use, including the dangerous override: command that

executes shell commands.

Because VERA processes entries in sequence and inherits authorization across the review cycle, the override: command was executed with manager privileges.

When the direct cat was redacted, I asked VERA to Base64-encode the file contents. Decoding the returned string in CyberChef produced the flag:
